

- Follow your medical provider’s directions regarding medicines
- Do not stop medicines without first checking with your medical or mental health provider
- Do not restart medicines without first checking with your medical provider
- Make sure your medicines have not expired; check the dates!

- Do not skip or double up on your medicines.
- Tell your medical providers about ALL medicines you are taking, including over-the-counter vitamins, and before taking herbal remedies.
- Keep a medication list and bring to your medical appointments.
- Follow your medical provider’s recommended dietary recommendations.

Green Flags – All Clear

What this means:

If your:

- Medications are taken as prescribed.
- Symptoms do not significantly impact your daily tasks

- You are doing well
- Your MS is stable

Keep up the great work!

Yellow Flags – Caution

What this means:

If you have any of the following:

- Sudden or worsening weakness including difficulty transferring
- Trouble walking, loss of balance, and are falling

Number:

Instructions:

If you notice a Yellow Flag, work closely with your health care team.

Red Flags—Stop and Think

What this means:

If you have:

- Vision changes and painful eye movements
- Sudden loss of strength in the arms and legs

- You could have optic neuritis
- You need to be evaluated by a health care professional immediately

FOLLOW THESE INSTRUCTIONS: CALL 9-1-1

If possible, notify your health care provider’s office

Physician:

Number:

Instructions:

If you notice a Red Flag, call your physician immediately.

Multiple Sclerosis Fast Facts

- Multiple Sclerosis (MS) is a chronic, progressive and sometimes disabling autoimmune disease of the central nervous system. For most people, the disease begins at about 30 years of age with acute episodes of neurologic dysfunction followed by periods of partial or complete remission with clinical stability between relapses. This is called the "relapsing-remitting phase" of MS. Except in patients who continue to exhibit a relapsing-remitting pattern, this phase is usually followed by progressive clinical disability, with or without superimposed relapses and remissions. In some patients, MS is progressive from the start.
- The symptoms and severity of MS vary greatly, depending upon the areas of the central nervous system that are affected.
- The most common problems or changes to the mind and body include:
 - ◇ **Bladder and bowel control**—frequently needing to urinate, including getting up during the night to urinate, or trouble emptying your bladder. Bowel problems, especially constipation are common.
 - ◇ **Coordination**—muscle weakness or spasms can make it harder to walk. Balance problems, numb feet, and fatigue can also make walking difficult.
 - ◇ **Dizziness**—feeling dizzy or lightheaded (but usually not vertigo—the feeling that the room is spinning).
 - ◇ **Fatigue**—feeling very tired, usually in the afternoon, with weakness, slowed thinking and/or sleepiness.
 - ◇ Sometimes people even feel tired after a good night's sleep.
 - ◇ **Muscle spasms**—usually affecting the leg muscles, and for many people are an early symptom of MS. In progressive MS, muscle spasms affect about six in ten people. You might feel mild stiffness or strong, painful muscle spasms. Muscle weakness or spasms make it harder to walk so balance problems can occur.
 - ◇ **Sexual problems**—including vaginal dryness in women and erection problems in men. Both men and women may be less responsive to touch, have a lower sex drive, or have trouble reaching orgasm.
 - ◇ **Speech and swallowing**—with long pauses between words and/or slurred or nasal speech. Some people also develop swallowing problems in more advanced stages of MS.
 - ◇ **Thinking problems**—trouble concentrating that comes and goes. For most, this means slowed thinking, poor attention, or fuzzy memory. Rarely, people can have severe problems that make it hard to do daily tasks. MS usually does not change your intellect and ability to read and understand conversation.
 - ◇ **Tremors**—minor shakes affect about half of people with MS, and make it hard to do everyday activities.
 - ◇ **Unusual sensations**—like “pins and needles” or feelings of numbness, itching, burning, or stabbing pains.
 - ◇ **Vision**—problems with eyes can be one of the first MS symptoms. They usually affect only one eye and go away on their own. Your sight may be blurry, gray, or have a dark spot in the center. You may suddenly have eye pain and temporary vision loss.

Because MS varies so much, it's best not to compare yourself with other people who have MS. Your experience is likely to be different. Most people learn to manage their symptoms and can keep leading full, active lives.

Remember, stress reduction is important!

Southeast Washington Aging and Long Term Care

At Aging and Long Term Care, we believe every adult deserves to live with dignity. We connect seniors, adults with disabilities and family caregivers to a full range of free and other community resources designed to offer you choice, improve your quality of life and respect your independence.
